CASE 3: Symmetry of molecules by Harvard and Basel

(a) Rotational symmetry transformation.

(b) Unknown symmetry transformation.

Figure 1: **Left:** a molecule is rotated by g admitting an analytical form. The distance matrix D between atoms is calculated by a known function f and remains unchanged for all rotations. **Right:** n samples $\{m, e\}^n$ where m is the molecule and e the bandgap energy. These samples approximate the function f whereas the class of functions g leading to the same bandgap energy is unknown.

CASE 4: Land-atmosphere coupling by University of Oslo

Figure 1: Used data sources: (a) Model domain of the NWP model MEPS and locations of the NetAtmo stations. (b) Surrounding of Finse and station locations. (c) Setup of the main site Finse1.

Figure 2: Relation of vertical and horizontal coupling: (a) Horizontal temperature difference between Finse1 and Finse2 versus vertical temperature difference at Finse1 colored based on a wind speed threshold (30 minutes temporal average), (b) decoupling metric at Finse1 versus copula entropy between Finse1 and Finse2 of temperature, wind speed, and the covariances corresponding to the fluxes of momentum $\text{cov}(u, w)$, sensible heat $\text{cov}(w, T)$, latent heat $\text{cov}(q, w)$ and CO_2 $\text{cov}(c, w)$ (30 minutes temporal average). Entropy calculation is based on time series of the same length to avoid a sampling size bias.

The **copent** package in R and Python for estimating copula entropy, transfer entropy, the statistic for multivariate normality test, two-sample test, and change point detection are available on CRAN and PyPI respectively. The source codes are provided on GitHub.
