

Copula Entropy

Theory and Applications

MA Jian

majian.2003@tsinghua.org.cn

Contents

- Lecture 1: Theory of copula entropy (1)
- **Lecture 2: Theory of copula entropy (2)**
- Lecture 3: Theoretical applications (1)
- Lecture 4: Theoretical applications (2)
- Lecture 5: Theoretical applications (3)
- Lecture 6: Evaluation
- Lecture 7: Generalizations
- Lecture 8: Real applications and softwares

Lecture 2: Theory of Copula Entropy (2)

① Physical Meaning

② Estimation

③ Theory Growth

Physical Meaning of Copula Entropy

- **Laws of Thermodynamics**

- First law: Conservation of energy

Energy cannot be created or destroyed and only changes from one form to another.

$$\Delta U = Q - W \quad (1)$$

- Second law: Entropy increase

The total disorder of an isolated system always goes up over time.

$$\delta Q = TdS \quad (2)$$

- Third law: Absolute zero limit

As temperature approaches absolute zero (0 K), a system's entropy approaches a constant minimum.

Physical Meaning of Copula Entropy

- **Physical meaning of copula entropy**
entropy reduction due to increasing order of thermodynamic systems

$$H_c(\mathbf{x}) \leq 0 \quad (3)$$

Physical Meaning of Copula Entropy

- **Systems that keep order**

- Earth
constantly receiving energy from Sun to keep earth system evolving
- Society
receiving energy from natural environment to keep society running
- Life
getting food and energy from outside to keep alive

Copula Entropy: Estimation

- **Parametric** Estimation by Definition

$$H_c(\mathbf{x}) = -E(\log c(\mathbf{u}; \alpha)). \quad (4)$$

- ① estimating empirical copula density $\mathbf{u}$ based on rank statistic

$$u_i = F_i(x_i) = \frac{1}{T} \sum_{t=1}^T \mathbf{1}(x_t^i \leq x_i) \quad (5)$$

- ② estimating the parameter α of copula density function $c(\cdot)$ with maximum likelihood method
- ③ calculating according to (4)

Copula Entropy: Estimation

• Non-Parametric Estimation Method¹

- ① estimating empirical copula density u based on rank statistic

$$u_i = F_i(x_i) = \frac{1}{T} \sum_{t=1}^T \mathbf{1}(x_t^i \leq x_i) \quad (6)$$

- ② estimating copula entropy with the kNN entropy estimation method

• Advantages

- distribution-free, non-parametric
- tuning-free, insensitive to parameters
- good convergence
- easy to implement
- low computation burden

Copula Entropy: Estimation

- **Conditional Mutual Information** Estimation

can be done with copula entropy estimators according to (7).

$$I(x; y|z) = H_c(x, z) + H_c(y, z) - H_c(x, y, z). \quad (7)$$

- 1 estimating the CE terms in (7) with CE estimator
- 2 calculating the result
