Copula Entropy

Theory and Applications

MA Jian
majian.2003@tsinghua.org.cn

Contents

- Lecture 1: Theory of copula entropy (1)
- **Lecture 2: Theory of copula entropy (2)**
- Lecture 3: Theoretical applications (1)
- Lecture 4: Theoretical applications (2)
- Lecture 5: Theoretical applications (3)
- Lecture 6: Evaluation
- Lecture 7: Generalizations
- Lecture 8: Real applications and softwares

Lecture 2: Theory of Copula Entropy (2)

1. Physical Meaning
2. Estimation
3. Growth of Theory

Physical Meaning of Copula Entropy

- **Laws of Thermodynamics**
  - First law: Conservation of energy
    Energy cannot be created or destroyed and only changes from one form to another.
    $$\Delta U = Q - W \tag{1}$$
  - Second law: Entropy increase
    The total disorder of an isolated system always goes up over time.
    $$\delta Q = TdS \tag{2}$$
  - Third law: Absolute zero limit
    As temperature approaches absolute zero (0 K), a system's entropy approaches a constant minimum.

Physical Meaning of Copula Entropy

- **Physical meaning of copula entropy**
  entropy reduction due to increasing order of thermodynamic systems

$$H_c(\mathbf{x}) \leq 0 \tag{3}$$

Physical Meaning of Copula Entropy

- **Systems that keep order**
  - Earth
    constantly receiving energy from Sun to keep earth system evolving
  - Society
    receiving energy from natural environment to keep society running
  - Life
    getting food and energy from outside to keep alive

Copula Entropy: Estimation

- **Parametric** Estimation by Definition

$$H_c(\mathbf{x}) = -E(\log c(\mathbf{u}; \alpha)). \tag{4}$$

1. estimating empirical copula density $\mathbf{u}$ based on rank statistic

$$u_i = F_i(x_i) = \frac{1}{T}\sum_{t=1}^{T} \mathbf{1}(x_t^i \leq x_i) \tag{5}$$

2. estimating the parameter α of copula density function $c(\cdot)$ with maximum likelihood method
3. calculating according to (4)

Copula Entropy: Estimation

- **Non-Parametric** Estimation Method[1]
  1. estimating empirical copula density $\mathbf{u}$ based on rank statistic

$$u_i = F_i(x_i) = \frac{1}{T}\sum_{t=1}^{T} \mathbf{1}(x_t^i \leq x_i) \tag{6}$$

  2. estimating copula entropy with the kNN entropy estimation method
- Advantages
  - distribution-free, non-parametric
  - tuning-free, insensitive to parameters
  - good convergence
  - easy to implement
  - low computation burden

Copula Entropy: Estimation

- **Conditional Mutual Information** Estimation

can be done with copula entropy estimators according to (7).

$$I(x; y|z) = H_c(x, z) + H_c(y, z) - H_c(x, y, z). \quad (7)$$

1. estimating the CE terms in (7) with CE estimator
2. calculating the result

Growth of Theory

Classical Information Theory
